

How to Build an Interactive Website Using Antigravity + Claude for Free

This guide shows you how to choose a website design, set up Antigravity with Claude, generate an interactive website, refine it, and publish it.

By the end, you'll have website files ready to upload to a hosting provider.

Step 1 – Choose Your Website Design

Open superdesign.dev/library and browse the available design options.

Review:

- UI components
- Website layouts
- Animations & styles

Choose one clear design direction rather than mixing unrelated styles.

Once you've selected a design, copy the prompt from the library.

Step 2 – Set Up Antigravity and Claude

Open the Antigravity platform and install the Claude extension or integration.

Antigravity and Claude work together as an automated website generation engine:

Tool	Role
Antigravity	The platform where you paste the design prompt and generate the website with Claude.
Claude	The extension or integration that understands your prompt, generates UI and animations, builds the functional structure, and handles basic interactivity.

Step 3 — Generate Your Website

1. Paste the copied prompt into Antigravity.
2. Let Claude process the prompt.
3. Wait a few minutes while the website is generated.

During generation:

- The layout is structured.
- UI components are created.
- Animations are added.
- Basic interactivity is handled.

Important: The result may not be perfect on the first try. Be specific, because a vague prompt can produce a poor result.

Step 4 — Refine and Improve the Website

Review the generated website and update the parts that need improvement.

Edit:

- Text content
- Colors and fonts
- Layout spacing

Add:

- Extra sections
- Buttons or CTAs
- More animations

If something looks off, re-prompt Claude with specific corrections.

Example prompt:

“Make hero section minimal with dark theme and smooth fade animation”

Step 5 — Publish Your Website

Once the website looks good, follow this sequence:

1. Export or download your website files.
2. Choose a hosting provider, such as Hostinger, Netlify, or Vercel.
3. Upload the website files to your chosen host.

4. Connect your domain.
5. Publish the website.
